

| OPERATION AND MAINTENANCE INSTRUCTIONS |

For polymer troughs delivered by ACO FUNKI

MAINTENANCE:

Products must be continuously cleaned. If you clean the products with the high pressure cleaner, ACO FUNKI recommends max pressure at 160 Bar and min distance at 150 cm.

Reservations are made regarding the use of unsuitable chemicals and components for cleaning purposes and/or for adding into the feed or water, that can discolor and/or damage, for ex., in form of corrosion.

In connection with cleaning, the products must dry out so that components are not under constant humidity.

OPERATION:

All products to be used as they are designed for.

If the damage occurs, this product or parts of it must be replaced to avoid further damages.

The products must not be exposed to impacts or sharp objects.

If damage occurs to glue fittings or concrete around the troughs so that water can penetrate beneath them, this must be fixed immediately to avoid the troughs or parts come loose. If partitions or similar go loose, they must be immediately cleaned and installed again with ACO FUNKI polymer adhesives.
